

## Boardic packing for containers.

When you need impact-resistant packing for transport, we can shape it to fit your products. We produce our packing in styrofoam, a material with many advantages, quite apart from its impact-absorbing ability. It can be shaped either entirely without tools or with simple steel cutters. That means little or no expense on equipment. We can also process small orders on a CAD cutting table, with low initial costs for the digital cutting files.

Styrofoam comes in different densities, hardness and colours to suit most applications. Anti-static material is also obtainable. Cellular polythene, which is the basis for styrofoam, is an eco-friendly material as it is made partly from recycled plastic and is also 100% recyclable into the same material again.

Let us give you a quotation for packing for your products.
